                                                                                                                                                                                                                                                                                                                                                                                               Claim 1; Page 2029; 2245pp; Japanese.

A single-stranded DNA (or its complementary strand or the corresp.
Cdouble-stranded DNA) which comprises one of the 7837, "GS" sequences
given in T19001-T26837 and which is able to hybridise to part of
chuman genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
sequences were obtained from 3'-directed cDNA libraries prepared
c from various human tissues; synthesis of cDNA wis intitated from the
CC 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
cuntranslated sequence is unique to a particular mRNA species, almost
CC all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC is constructed so as to reflect accurately the relative abundance of
CC different mRNAs in the particular tissue from which it was derived.
CC determined (esp. using primers and probes derived from the GS
CC sequences) as a means of diagnosing abnormal cell function or for
recognising different cell types.
CC sequence 103 BP; 33 A; 21 C; 25 G; 23 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               14065 TTATTTATTTTGAGACGGAGTCTCACTCTGTCACCCGGGCTGGAGTGCAGTGGCGCGAT 14124

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 1; Page 758-759; 2245pp; Japanese.
A single-stranded DNA (or its complementary strand or the corresp.
double-stranded DNA) which comprises one of the 7837 "GS" sequences
r RNA; mRNA; relative abundance; frequency non-biased library; diagnosis; detection;
                                                                                                                                                                                                                                                                                                      Identifying gene signatures in 3'-directed human cDNA library for diagnosis of abnormal cell function, by preparing cDNA that reflects relative abundance of corresp. mRNA in specific human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying gene signatures in 3'-directed human cDNA library for diagnosis of abnormal cell function, by preparing cDNA that reflects relative abundance of corresp. mRNA in specific human

Claim 2: Claim 3: Claim 
c given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by in the particular mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types. 27 G; 21 G; 31 T;

The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A.20-MAR-1999 (first entry)

Constructed by Bento Soares and M. Fatima Bonaldo."

Total Library 1st strand cDNA was prepared from 3 pooled polylinker; 1st strand cDNA was prepared from 3 pooled germ cell tumors, and was then primed with a Not I oligo(dT) primer. Double-stranded cDNA was 11gated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pr773 vector. Library is not normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo. "

Double-stranded CDNA was ligated to ECORI adaptors, 5 cycles of PCR applied to the CDNA with an adaptor-specific primer, and the resulting PCR product subcloned into pAMP10 by the UDG-cloning method (Life Technologies). Average insert size is 600 bp. NOTE: Not directionally cloned. This library was

Double-stranded cDNA was ligated to EcoRI adaptors, 5 cycles of PCR applied to the CDNA with an adaptor specific primer, and the resulting PCR product subcloned into pAMPIO by the UDG-cloning method (Life Technologies). Average insert size is 600 bp. NOTE: Not directionally cloned. This library was constructed by David Krizman."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

Patent No. 5830670
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Wands, Jack R.
TITLE OF INVENTION: Neural Thread Protein Gene Expression and Detection
TITLE OF INVENTION: of Alzheimer's Disease
NUMBER OF SEQUENCES: 121
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

See X05250 for corresponding normal gene sequence
In the defective LDL-receptor gene the deletion ocurred between two
alu-repetitive sequences, that are in the same direction, the
deletion eliminates exons 13 and 14 and changes the reading frame
of the resulting spliced mRNN.
Data Kindly reviewed (07-DEC-1987) by HUMPHRIES S.
                                                                                                                                                                                                                             Eukaryota; Metazoa; Chordata; Vertebrata; Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.

Williamson, R. and Humphries, S.
Unequal crossing-over between two alu-repetitive DNA sequences in the low-density-lipoprotein-receptor gene. A possible mechanism for the defect in a patient with familial hypercholesterolaemia for Eur. 3. Blochem. 164 (1), 77-81 (1987)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               See X05248 for corresponding normal gene sequence. In the defective LDL-receptor gene the deletion ocurred between two alu-repetitive sequences, that are in the same direction, the deletion eliminates exons 13 and 14 and changes the reading frame of the resulting spliced mRNA.

Unequal crossing-over between two alu-repetitive DNA sequences in the low-density-lipoprotein-receptor gene. A possible mechanism for the defect in a patient with familial hypercholesterolaemia Bur. J. Blochem. 164 (1), 77-81 (1987)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       *Source: hypercholesterol aemia
See X05248 for corresponding normal gene sequence
In the defective LDL-receptor gene the deletion ocurred between two
allu-repetitive sequences, that are in the same direction, the
deletion eliminates exons 13 and 14 and changes the reading frame
of the resulting spliced mRNA.

See X05250 for corresponding normal gene sequence
In the defective LDL-receptor gene the deletion ocurred between two
alu-repetitive sequences, that are in the same direction, the
deletion eliminates exons 13 and 14 and changes the reading frame
of the resulting spliced mRNN.
Data kindly reviewed (07-DEC-1987) by HUMPHRIES S.
                                                                                                                                                                                                                                                                                                                                                            Eukaryotza, Metazoa, Chordata, Vertebrata, Mammalia, Eutheria, Primates; Catarphini, Hominidae, Homo.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Wew isolated nucleic acid segments from the human genome - used for determining polymorphic forms for use in e.g. forensics, paternity

PT determining polymorphic forms for use in e.g. forensics, paternity

PT testing or phenotypic typing for disease

CI aim 1, Page 218: 310pp; English.

X10269-X12397 are human DNA fragments which contain biallelic polymorphic can be used in the appropriate IUPAC-IUB ambiguity code. These fragments can be used in misches for determining polymorphic forms in an individual for use in methods for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases cub- as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Andrich syndrome, Fabry's disease, familial typercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary cautoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such can cautoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such can sequents can also be used to produce medicaments for the treatment or more, when a faurch diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          23012 GTGGCTCATGCCTGTAATCCCAGCACTTTGAGAGGCTGAAGAAGGAGGATCGCTTGAGTC 23071

determining polymorphic forms for use in e.g. forensics, paternity testing or phenotypic typing for disease
Claim 1; Page 219; 310pp; English.

X10269-X12937 are human DNA fragments which contain biallelic polymorphic markers which have been isolated using the primers represented in X09121-X10268. The base occupying the polymorphic site is indicated by the appropriate IUPAC-IUB ambiguity code. These fragments can be used in methods for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insiplidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Pabry's disease, familial phenotytosis, polycystic kidney disease, hereditary spherocytosis, von Willebrand's disease, hereditary spherocytosis, von Willebrand's disease, hereditary hemorrhagic telangiectasia, familial colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               23012 GTGGCTCATGCCTGTAATCCCAGCACTTTGAGAGGCTGAAGAAGGAGGATCGCTTGAGTC 23071

Sequences shown in V41230 to V41247 represent nucleotide sequences of sequences shown in V41230 to V41247 represent nucleotide sequences of mouse EST from tagged CDNA clones. These are used in the method of the invention of screening for human developmental genes. The method comprises inserting a promoterless reporter gene into a non-primate mammalian embryonic stem cell (ESC) genome and identifying cellular transcripts that encode the reporter gene product. Fragments of genes encoding these transcripts are cloned and sequenced. A gene encoding the are includes unknown sequences is selected and expression level of the gene encoding the transcript, or part of it, in different cell types and/or different developmental stages is detected. A gene showing differential expression is selected and expression levels of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0; Gaps

X10269-X12937 are human DNA fragments which contain biallelic polymorphic

```
Whisylated nucleic acid segments from the human genome - used for determining polymorphic forms for use in e.g. forensics, paternity per determining polymorphic forms for use in e.g. forensics, paternity protecting or phenotypic typing for disease

Claim 1: Page 218; 310pp; English.

Claim 1: Page 218; 310pp; English.

Claim 1: Page 218; 310pp; English.

CC markers which have been isolated using the primers represented in the perpension of the appropriate IUPAC-IUB ambiguity code. These fragments can be used in the appropriate IUPAC-IUB ambiguity code. These fragments can be used in the appropriate IUPAC-IUB ambiguity code. These fragments can be used in the et.g. forensics, paternity testing or form in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, cup as agammaglobulinemia, diabetes insipidus, Easch-Nyhan syndrome, hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, herefitzy spherocytosis, von Willebrand's disease, tuberous sclerosis, herefitzy spherocytosis, papearance (e.g. baldness, obesity), strength, speed, autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such candurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid coppopalyzats of such diseases.

CC prophylaxis of such diseases.

markers which have been isolated using the primers represented in X09121-X10568. The base occupying the polymorphic site is indicated by the appropriate IUPAC-IUB ambiguity code. These fragments can be used in methods for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary spherocytosis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

double-stranded DNA (or its complementary strand or the corresp.

A single-stranded DNA) which comprises one of the 7837 "GS" sequences
glowe in 119001-T26837 and which is able to hybridise to part of
thuman genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
sequences were obtained from 3'-directed cDNA libraries prepared
from various human tissues; synthesis of cDNA was initiated from the
3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
untranslated sequence is unique to a particular mRNA species, almost
all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
is constructed so as to reflect accurately the relative abundance of
different mRNAs in the particular tissue from which it was derived.
The appearance frequency of a given GS in a cDNA library can be
determined (esp. using primers and probes derived from the GS
sequences) as a means of diagnosing abnormal cell function or for
recognising different cell types.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                3559 TTTTTTTTTTTGAGACGGAGTCTAGCTCTGTCGCCCAGGCTGGAGTGCAGTGGCACCATC 3618

A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3 'directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     100 TITGITIGITICAAACAGAGTGTCACTCTGTCACCCAGGCNGGAGTGCAANGGTGCAATC 41

X10269-X12937 are human DNA fragments which contain biallelic polymorphic x10269-X12937 are human DNA fragments which contain biallelic polymorphic x10269-X12937 are human DNA fragments which contain biallelic polymorphic commarkers which have been isolated using the primers represented in commerce x00121-X10268. The base occupying the polymorphic site is indicated by the appropriate IUPAC-IUB ambliguity code. These fragments can be used in commethods for determining polymorphic forms in an individual for use in commethods for determining polymorphic forms in an individual for use in compact and a gagmmagolobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, caucha a gagmagolobulinemia diabetes insipidus, Lesch-Nyhan syndrome, cappercolemia, polycystic kidney disease, hereditary compact telangiectasia, familial colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecte, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous contractive and paracteristics such as allonest and a paracteristics such as a paracteristics and a paracteristics contractive internity appendix.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ï
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              24415 TGTATTCCCAGCACTTT - - GGAGGCAGAGGCGGGCAGATCACTTGAGGTGGGGAGTTCGA 24472
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        as longevity, appearance (e.g. baldness, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or

untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types.

Sequence 102 BP; 45 A; 26 C; 12 G; 13 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            3'-end of mRNA by using poly(") as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived.

Claim 1. Page 2029; 2245pp; Japanese.
A single-stranded DNA (or its complementary strand or the corresp.
Couble-stranded DNA) which comprises one of the 7837 "GS" sequences
gluen in T19001-T26837 and which is able to hybridise to part of
the first of the comprises one of the 7837 "GS" sequences
couple-stranded DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
sequences were obtained from 3'-directed CDNA libraries prepared
from various human tissues; synthesis of CDNA was initiated from the
contranslated sequence is unique to a particular mRNAs ince the 3'-
untranslated sequence is unique to a particular mRNAs. Each library
is constructed so as to reflect accurately the relative abundance of
different mRNAs in the particular tissue from which it was derived.
The appearance frequency of a given GS in a cDNA library can be
determined (esp. using primers and probes derived from the GS
sequences) as a means of diagnosing abnormal cell function or for
